WHERE TO CHECK ON THE FLOOR-LEVEL

- Start with the biggest vent grille (often in a hallway or main room)
- Then check two room vents in different rooms
- Shine a flashlight just inside and look for obvious buildup, clumps, damp staining, or debris

TOOLS NEEDED

- Flashlight
- A printout of this guide
- Phone camera for photos

TIME REQUIRED

- Roughly 10 minutes

SAFETY PRECAUTIONS

- **ONLY** inspect what you can safely see from the floor
- **AVOID** ladders, attics, crawl spaces, and don't open any equipment panels
- **DON'T TOUCH** wiring or disturb anything that looks like growth, moisture, or pest debris
- **IF YOU SMELL** gas, see smoke, or notice an electrical burning smell, stop and call the appropriate professional

This checklist cannot diagnose mold, air quality, or mechanical issues. If you're unsure, call us for a professional visual check.

LOOKS NORMAL

- ☐ Light dust on vent covers only
- ☐ A little dust inside one vent, not multiple vents
- ☐ Dust that makes sense after normal living, pets, or a recent remodel
- ☐ Filter looks normal for its age and was changed on schedule
- ☐ No unusual odor when the system turns on

WORTH CHECKING

- ☐ Dust returns quickly after you clean surfaces
- ☐ Several vents show visible buildup just inside the opening
- ☐ One room is consistently dustier than the rest
- ☐ A stale or musty odor appears only when the system runs
- ☐ Airflow feels weaker in one or two rooms (not the whole house)
- ☐ Filter seems to load up faster than it used to

CALL A PROFESSIONAL

- ☐ Clumps of debris or thick buildup visible inside multiple vents
- ☐ Signs of moisture near vents (rust, staining, dampness)
- ☐ Suspected growth that looks fuzzy or patchy inside vents
- ☐ Pest debris, nesting material, or droppings near duct openings
- ☐ Debris blows out of vents when the system starts
- ☐ Major airflow reduction across several rooms, not just one
